

TOPIC 2 — ASSESSMENT

Understanding GPT Instructions: Instruction Drafting

Project: AI Job Application Assistant

Assessment Deliverables: Instruction Block, Test Results Summary, Working Custom GPT, and Loom Video

1. Assessment Overview

This assessment demonstrates how explicit GPT instructions can define role, scope, tone, output format, and behavioral constraints, and how those instructions can be tested and refined for consistent behavior.

The working GPT is an **AI Job Application Assistant** designed for fresh graduates, college students, and entry-level job seekers. Its purpose is to analyze job descriptions, compare user-provided backgrounds with job requirements, identify skill gaps, improve resume content, draft application materials, and provide application-readiness checklists.

2. Instruction Block

The submitted instruction block defines the GPT's Role, Scope, Tone, Output Format, ten explicit Constraints, and a Consistency Rule. The constraints include no fabrication, strict scope control, handling missing or unclear input, no guaranteed outcomes, factual accuracy, separation of facts from suggestions, requested-format compliance, privacy, transparency, and no recruiter impersonation.

The full instruction block is submitted separately as **instruction_block.md**. [filecite turnOfile0L80-L110](#)

3. Testing Method

The GPT was tested against five required query types:

- In-scope query — job requirement and skill-gap analysis.
- Out-of-scope query — unrelated general knowledge question.
- Casual query — friendly conversation.
- Vague query — ambiguous application request.
- Format-specific query — exactly five requested points.

4. Initial Testing and Instruction Refinement

Initial testing identified two inconsistencies. The out-of-scope test was answered directly instead of being redirected, and the vague application request caused the GPT to assume a specific application from previous context.

Constraint 2 was strengthened to enforce strict scope and redirect clearly unrelated requests. Constraint 3 was strengthened to require targeted clarification when the application or role is ambiguous.

5. Final Test Results

Test	Query Type	Final Result
1	In-Scope	Pass
2	Out-of-Scope	Pass after refinement
3	Casual	Pass

4	Vague	Pass after refinement
5	Format-Specific	Pass

Final consistency: 5 out of 5 tests behaved as expected after instruction refinement.

The complete test evidence and retesting details are submitted separately as **test_results_summary.md**.

6. Loom Video

Assessment demonstration video:

<https://www.loom.com/share/c2ec1c690bd64cd79239e126c020aeaavso>

The video demonstrates the instruction block, the working Custom GPT, the five test cases, the instruction refinements, and the final test-results summary.

7. Submission Checklist

- instruction_block.md — completed instruction block
- test_results_summary.md — testing, refinement, retesting, and final results
- Loom video link — assessment walkthrough
- This PDF — consolidated assessment submission summary
